

320

- **Stability**
- **Adjustability**
- **Axiality**
- **Capacity**

Advantages

- **STABILITY:** this is **true**. The hinges with three pins ensure perfect stability throughout the cycle of opening and closing the door.
- **ADJUSTABILITY:** this is an **exclusive**. This is the first hinge with three pins which, thanks to an exclusive Otlav patent, enables you to adjust the height of the door up to a maximum of 6 mm, without dismantling the door.
- **AXIALITY:** a **certainty**. A perfect alignment, with a much better aesthetical appearance.
- **CAPACITY:** a **security** measure. In terms of capacity, there is simply no comparison between normal hinges and hinges with three pins, which are normally used for particularly heavy doors.

Functionality

3venti LIFT is made with a bush at each end, usually fixed to the frame. One of those is threaded inside and carries the ring nut, which is also threaded and can be lifted up by as much as 6 mm. Consequently, the middle bush, which is usually fixed to the door, is lifted too, thereby also lifting the door to which it is fixed.

Once the adjustment has been carried out, the pivot is placed in its final position.

In the **vasistas version (or burglar-resistant)** there is also a headless screw in the upper side bush. Once the adjustment has been carried out and the pivot has been placed in its final position, this screw is screwed firmly into one of the two facets of the pivot, thereby preventing the pivot from being removed.

Accessories

The same equipment that is currently being used for the traditional 320 can also be used to fit this hinge. The caps **currently used** for the standard 320 designs can be assembled.
